.Q: Where does matlab code gets the source when i run the file I have a matlab file which invokes a jupyter notebook. I am actually able to run the file but I don't know where matlab is getting the source code for executing that file. I don't use any matlab syntax in the file. To run this file Matlab Command: jupyter notebook -i sample.ipynb A: Jupyter notebook is just a web app. I suppose the file you run was the result of a to-be-compiled.m file. Now, this file is compiled to some binary. That binary file is executed by a jupyter command interpreter The jupyter command interpreter is actually a jupyter kernel which is a computer program A jupyter kernel is also the entry point of the jupyter server When you launch a jupyter notebook server (by launching the jupyter binary with the same parameters as above for the jupyter notebook server), A jupyter kernel is launched, Which is the entry point of the jupyter server. The jupyter server is launched from the jupyter notebook server. The jupyter kernel launches the jupyter notebook server The jupyter notebook server launches the jupyter kernel The jupyter kernel is able to access the program code in the.m file So the jupyter kernel is actually able to run the code of your.m file. A: Usually, the same Jupyter/Python kernel is used to launch notebook / Jupyter or IPython or Spyder or... and runs code in an execution cell or sometimes memory in other languages like Julia, Python... In this case, you had a pure MATLAB function in your notebook. It invokes a kernel / Jupyter notebook. Hi guys! This is a concept I have for the new Vanillaware game about an underage love-struck girl and her undead lover who have been stuck in the girls' high school for centuries because they were the student body and all the teachers are extinct because they were ba244e880a
